Purpose: This book is intended for scientists and researchers in
the field of spectroscopy, as well as for technical personnel
using spectrum analysis in various industries.

Contents: This volume contains 177 scientific and technical studies
of atomic spectroscopy presented at the 10th All-Union Confer-
ence on Spectroscopy in 1956. The studies were carried out by
members of scientific and technical institutes and include
extensive bibliographies of Soviet and other sources. The
studies cover many phases of spectroscopy: spectra of rare earths,
electromagnetic radiation, physicochemical methods for controlling
uranium production, physics and technology of gas discharges,
optics and spectroscopy, abnormal dispersion in metal vapors,
spectroscopy and the combustion theory, spectrum analysis of ores
and minerals, photographic methods for quantitative spectroscopy,
analysis of metals and alloys, photometry, photometry of the
hydrogen spectrum, analysis of metal by means of isotopic tables, and
statistical study of variation in the parameters of calibration
curves, determination of traces of metals, spectrum analysis in
metallurgy, thermochemistry in metallurgy, and principles and
practice of spectrochemical analysis.

AUTHOR: Gavrilov, G.A.

TITLE: Spectroscopic Investigations of Complex Formation in the Phenol-nitrobenzene System

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Fizika, 1960, Nr 1, pp 208 - 216 (USSR)

ABSTRACT: The author obtained the ultraviolet (220-450 mμ) absorption spectra (Figures 1 and 2, Table 1) of vapours and n-hexane solutions of the system and of pure substances, using a spectrophotometer SF-4. The spectra of nitrobenzene and phenol obtained in this way agreed well with the published data (Refs 10-12). The author measured also the optical densities of several series of isomolar solutions of the system in the visible region of wavelengths (Figures 3, 4). From the visible absorption spectra the author concluded that complexes with compositions 1:1, 1:2, 2:1 are formed. The equilibrium constant ($K_1 \sim 0.05$ litre/mole) and the optical extinction coefficient ($\epsilon_1 = 2-3$ litre mole⁻¹ cm⁻¹) of the 1:1 complex in the 420-450 mμ region were obtained graphically (Figure 5 and Table 2). For the

(phenol)₂:(nitrobenzene) complex the author found $K_2(\epsilon_2 = \epsilon_0)$ in the 420-450 mμ region (Figure 6 and Table 3) and $\epsilon_2 = 0.6$ at 421 mμ; here K_2 is the equilibrium constant of the complex and ϵ_2, ϵ_0 are the optical extinction coefficients of the complex and of pure nitrobenzene, respectively. The values of $K_2(\epsilon_2 = \epsilon_0)$ were 0.0007, -0.0013 and -0.0025 for 420, 425 and 450 mμ, respectively (Table 3). Acknowledgments are made to Professor N.A. Prilezhayeva, who directed this work, and to V.I. Danilova for their advice. There are 6 figures, 3 tables and 20 references, 9 of which are Soviet, 5 English, 3 German and 3 French.

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Fizika,
1960, No. 6, pp. 173-174

TEXT: Electronic spectra have been used to study complex formation in phenol-nitrobenzene (Ref. 1) and dioxybenzene-nitrobenzene (Ref. 2,3) systems. The present note described an investigation of the bonding mechanism of phenol-nitrobenzene complexes using the infrared absorption spectra of solutions of phenol in carbon tetrachloride (Curve 1 in Fig. 1) and of phenol in nitrobenzene (Curve 2 in Fig. 2). The spectra were recorded in the 2.5 to 3.5 μ region, representing the fundamental valence vibrations of the OH group, using a spectrophotometer MKC-6 (IKS-6). Lack of the 2.95 μ band, characteristic of hydrogen bonding, in Curve 2 indicated that phenol-nitrobenzene complexes

AUTHOR: Gurevich, S. B.; Breydo, I. I.; Gavrilov, G. A.

TITLE: Signal-to-noise ratio measurement and gradation vs. frequency characteristic of photographic materials

SOURCE: Tekhnika kino i televideniya, no. 5, 1963, 1-8

TOPIC TAGS: photomaterial characteristics, Mikrat, Kinopositiv, AM-1 Kinonegativ, R-30 Ferrania Kinonegativ, Panchrom, Agfa Dispositiv, Agfa Isochrom, Agfa Gelb rapid, Agfa Astro, Ilford ordinary

ABSTRACT: Data on photonnoise (granularity) and on signal-to-noise ratio for various photomaterials were practically nonexistent in the Soviet literature. The article offers a description of the apparatus used in experiments and the photonnoise and signal-to-noise-ratio data for a number of Soviet and German films (Mikrat, Kinopositiv, Kinonegativ, Panchrom) and plates (Agfa, Ilford ordinary). Numbers of gradations discernible on 100- and 2,500-sq.-micron areas are given. Table 2 (see Enclosure) compares characteristics of Soviet, German, and American photomaterials. From the experimental gradation-frequency curves, it was found that the panchromatic fine-grain film, Agfa Diapositiv plates, and MZ cinema positive film have the highest resolution, while the P-10 film and Agfa Astro plates, Card 1/2

L 10312-63

ACCESSION NR: AP3001455

the lowest. It is claimed that the error associated with the method of noise measurement is 4-8 per cent. Orig. art. has: 11 formulas, 8 figures, and 2 tables. 2

TITLE: Photographic noise and the signal/noise ratio of various photographic materials

SOURCE: Zhurnal nauchnoy i prikladnoy fotografii i kinematografii, v. 8, no. 4, 1963, 284-292

TOPIC TAGS: photography, noise, photographic noise, signal/noise ratio, photographic material, MF 4 microphotometer, KMVL 1 quadratic millivoltmeter, M 95 microamperemeter, Agfa photo plate, Ilford photo plate, photographic film, Mikrat film, Mikrat 200 film, Mikrat 300 film

ABSTRACT: This work was carried out in order to measure the intensity of noise and the signal/noise ratio of various photographic materials. It was assumed that noise intensity was related to the granularity of material, i.e., the number of the exposed grains in a uniformly illuminated section of the film. The experimental assembly consisted of a modernized MF-4 microphotometer, a KMVL-1 quadratic millivoltmeter, and a M-95 microamperometer. Agfa plates and Ilford plates used

Card 1/2

ACCESSION NR: AP3003607

in astronomy and spectroscopy, and various types of films (including Mikrat films) were studied. It was established that: 1) the noise intensity showed a 3- to 4-fold variation during the transition from fine- to coarse-grained materials; 2) the strongest noise variation was observed in the negative materials; 3) noise intensity of fine-grained negative materials differed little from that of positive materials; 4) the signal/noise ratio at a given film-blackening density depended strongly on the intensity of the fog. For this reason some materials of equal granularity had different signal/noise ratios. Orig. art. has: 3 tables and 6 figures.

TITLE: Measuring signal-to-noise ratio in electron-optical amplifiers

SOURCE: Radiotekhnika i elektronika, v. 11, no. 7, 1966, 1327-1329

TOPIC TAGS: electron optical amplifier, electronic amplifier

ABSTRACT: To date, the noise in electron-optical amplifiers has been evaluated either qualitatively or theoretically (S. B. McLane et al., Rev. Sc. Instr., 1964, 35, 10, 1297). The present article describes the method and the results obtained in the measurement of the signal-to-noise ratio (SNR) at the amplifier output. The method is similar to that used in photography. The luminous flux at the amplifier output was varied by neutral light filters; the cell area was set by an adjustable slit; the frequency band was fixed by suitable frequency filters. This formula was used:

$SNR = (i - i_d)R / \sqrt{U_n^2}$, where i - photomultiplier current proportional to the luminous flux, i_d - dark current, R - load resistance (1 Mohm), $\sqrt{U_n^2}$ - rms noise voltage indicated by an rms millivoltmeter. It was found that the slit shape does not affect the measured SNR; the SNR value essentially depends on the slit-cut area and vary slightly with this area location. An SNR = 15 was measured in an amplifier having a gain of 8.6×10^4 , an input illumination of 0.005 lux, and an area of $0.2 \times 0.4 \text{ mm}^2$. Orig. art. has: 1 figure and 1 formula.

Approximation methods of analysis of transients (Priblizhennyye metody analiza perekhodnykh protsessov) Moscow, Izd-vo "Sovetskoye radio," 1966, 151 p. illus., biblio. 12,500 copies printed

TOPIC TAGS: linear aperiodic system, transient process, automatic regulation, approximation method, linear system, Laplace transform, data sampling

PURPOSE AND COVERAGE: The book provides the mathematical apparatus necessary for the analysis of transient processes in linear aperiodic systems. This apparatus may also be used for computation of nonlinear systems in which the method of piecewise linear approximation can be applied effectively. Thus, the mathematical apparatus presented in the book can be used, for example, for the computation of various sampled-data schemes or for the analysis of transient processes in automatic regulation systems. The book gives examples of the application of this apparatus for the analysis of some sampled-data schemes in semiconductor instruments. The book is intended for engineers working on the design of radio devices; it can also be used by graduate students of radio engineering departments.

AUTHOR: Gavrilov, G.P.

SOV/20-128-1-4/58

TITLE: Certain Conditions for Completeness in Countable-Valued Logic

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 128, Nr 1, pp 21-24 (USSR)

ABSTRACT: Let P_m be the set of all functions defined on the set E_m with the power m , and the values of which lie in this set. The subset \mathcal{K} is called complete system in P_m , if its closure with respect to the superposition (see [Ref 1]) is identical with P_m . The subset \mathcal{M} is called precomplete class, if it is no complete system, but becomes a complete system by adding an arbitrary function belonging to P_m and not to \mathcal{M} . The knowledge of the precomplete classes yields necessary conditions for the completeness of a system of functions. In the present paper the author gives two precomplete classes and formulates two criteria of completeness for special systems. Altogether there are 4 theorems. The paper is a summary of the certificate of the author (1958) and is based on the investigations of S.V. Yablonskiy [Ref 1, 2, 7].

TITLE: Fabrication of steam passing parts of experimental turbines and compressors

PERIODICAL: Referativnyy zhurnal, Mashinostroyeniye, no. 10, 1961, 17, abstract 10I135 (V sb. "Issled. elementov parovykh i gaz. turbin i osevykh kompressorov". [Tr. Leningr. metallich. z-da, 5¹, Moscow-Leningrad, Mashgiz, 1960, 480-486)

TEXT: The authors report on tests of single stages up to 50 mm high and with a mean diameter of 450 mm of the experimental 3TB-1 (ETV-1) air turbine at a pressure of 1.5 kg/cm² and 80°C, n = 10,000 rpm. Two rotor types are utilized - single-disk cantilever-type and multistage rotor with several shell-type disks, as well as two guiding devices - a non-detachable one and one split over the diameter. The authors describe the technology of fabricating individual components of steam passing parts, operating and guiding blades, disks, etc. There are 12 figures. B

Functions of the algebra of logic and Post's classes (Funktsii algebry logiki i klassy Posta) Moscow. Izd-vo "Nauka", 1966. 119 p. illus., biblio., index. 10,000 copies printed.

Series note: Matematicheskaya logika i osnovaniya matematiki

TOPIC TAGS: ~~logic algebra~~, ~~logic algebra function~~, cybernetics, *algebraic logic*, *mathematic logic*, *class theory*

PURPOSE AND COVERAGE: This book is intended for all those interested in the algebra of logic and theoretical cybernetics. The work is based on Post's work in the algebra of logic and is essentially a summary of his "Two-valued Iterative Systems", first published in 1941. The general concept of proof, the formulation of many of the lemmas, and some of the reasoning is borrowed from Post's work. However, in an effort to simplify the presentation, the authors obtain a structure for closed classes of logic algebra functions which is simpler than Post's.

Title : The Grenadine Carnation. (Gvozdika grenadin).

Orig Pub: Sad i ogorod, 1957, No 6, 71-73.

Abstract: The method is described of cultivating the biannual grenadine carnation which was used since 1952 by the "Likhehora" ornamental horticultural combine. The beginning of blossoming in the grenadine carnation coincides with the finishing of florescence in the Barbatus carnation and lasts 2-3 weeks up to the beginning of flowering of the Shabo annual carnation. The decorative value of the grenadine carnation is greater than that of Barbatus and is hardly inferior to the Shabo.

AUTHOR: ^{55,44}Gavrilov, I. A.; ^{55,44}Kolachevskiy, N. N. ²⁴_B

TITLE: Evaluation of the noise level of a germanium injection modulator ^{55,44} ²¹

SOURCE: Radiotekhnika i elektronika, v. 10, no. 8, 1965, 1486-1488

TOPIC TAGS: injection modulator, free hole lifetime, ferrite modulator, klystron modulator, UHF modulator

ABSTRACT: The noise characteristics and the transient and frequency response of injection modulators based on n-type Ge are investigated. Two samples in the form of rectangular prisms (35 x 5 x 3.5 mm), with resistivities of 10 ohm-cm (sample A) and 40 ohm-cm (sample B)) were mounted on the opposite ends of a T-joint waveguide. The measurements were made at 9300 Mc with a modulating signal applied directly to the ohmic contacts. The pulse response of the forward biased junction indicated a free-hole lifetime of 80 μ sec for sample A and 200 μ sec for sample B. Determination of power loss as a function of

Card 1/2

L 01826-66

ACCESSION NR: AP5020127

applied d-c current I flowing through the p-n junction showed that the loss at $I = 15$ μ amp relative to the loss at $I = 0$ was 2.8 db for sample B and 0.5 db for sample A. The noise level was measured in the following fashion: First, the noise introduced by the signal detectors was calibrated by a klystron modulator modulated by a 25-cps sine wave. Next, the klystron was replaced with the semiconductor modulator (sample B) and the noise level again measured. The negligible difference ($\leq 10\%$) in readings of the noise spectral density indicates that the noise level of the injection modulators is below $5 \times 10^{-16} \text{ V}^2/\text{cps}$.
